

Environment

Niugini Nickel has a strong commitment to the environment and operating in an environmentally sustainable way.

The Wowo Gap natural environment comprises tropical rainforest with moderate to large sized trees, bushes and undergrowth. The cover is virtually continuous with very few gaps.

The area has a tropical monsoonal climate with an average rainfall of 1.5 to 2 metres in the wetter part of the year between December and April.

Niugini Nickel personnel conduct tree surveys to monitor the impact of exploration on the forest environment.

As an example, we try and minimise the loss of trees and recycle any timber from harvested trees by using a portable timber milling machine to provide materials to build new office facilities and housing at the Wowo Gap project site.

Water quality of nearby creeks and streams is also closely monitored on a regular basis. Flow rates are also monitored.
